

Hi everybody I just wanted to go over my new mosquito magnet. This is the independent model. I am here in Michigan, we've got a lot of mosquitoes this year and they are all over. I'm not sure if you can see it that well, which is why I brought a piece of white paper out here just to show how attracted they are to this machine and maybe you can see it better with a white background how many mosquitoes are really here. They just love the machine because of the CO2 that it puts out and the heat. They're really attracted to it.

The machine attracts the mosquitoes to it. The scent and everything comes out here along with the heat, comes out straight down and then the vacuum goes up here and it sucks them up. It's a great design I think, I've used a lot of different mosquito traps. I think this is one of the best in terms of its design. I just wanted to show you this have been out here for about four or five days now.

This is the trap part of it you can see there is a lot of mosquitoes in here. You can see them flying around. So that they don't get out, you pull a draw string. You saw a couple of them get away. This is the amount of mosquitoes that have been caught in here over the last several days. It's about half full, that's a lot of mosquitoes, there are thousands of mosquitoes in there. Right now there are still some live ones, so all you really need to do is to pull the draw string closed tight and then just let that one set and the mosquitoes will dehydrate and die. I just have a second net and I pop it in there, make sure it is opened good, and then attach the little hooks right here so that keeps the bag open and fully able for the mosquitoes to get in, close the top and you are good to go.

The other thing that needs to be replaced once in a while is the octenol, which fits in a little capsule down here. It's got a scent to it that attracts the mosquitoes and it mimics the human breath. Along with the heat and the CO2, that's what makes them come to the unit, get sucked up in there, go to the bag, dehydrate and die. I give it a thumbs up, I'm really happy with it. It's catching a lot of mosquitoes around here and there's a lot more to go. They just keep on coming, but at some point in time you do break the breeding cycle to a large degree and we have seen a big impact in the lesser number of mosquitoes up at the deck area.

We keep it back out here in the woods, away from the living area, and that makes it so that the mosquitoes are kept here in the shade, in the woods and that they don't travel so far and they get caught here. I am real happy with it, I think you would be too. Definitely a thumbs up on this one.

Alright you say my two week catch out there in the bag, now I have been running this since. Well it is June 16th

today, and the mosquitoes really came out. A couple of weeks from the end of May. I have been emptying all my mosquitoes into this five gallon bucket and wait until you see how many they are. I give you my word this is just from this year. Now that's a lot of mosquitoes, that is the catch from this year. So far in there are literally, there's got a be a million mosquitoes in there maybe.

Definitely cut back on the number of mosquitoes that's in my yard, but It's been a wet year up here and there's still a lot of them out. I wouldn't be surprised that I fill up this five gallon bucket before the year is over. They're about that full right now. I just dump them in the bucket, put a lid on top, and that's my catch. Hope you catch as many too, you would be able to enjoy your summer a lot better. Have a good one!
