

Hi I'm Melissa from NorthlineExpress here to talk to you about step three in our four step process to ultimate mosquito control. Now by this point you should have already found, and either treated or eliminated your mosquito breeding grounds and you should have placed, your mosquito trap, or traps around the perimeter of your property of your outdoor living space.

If you've done all of that, then you're ready for step three, and step three in our mosquito control process is to use a backyard mister, or mosquito misting system to repel and kill any mosquito's that may it past steps one and two, and they're still active in your outdoor living space.

Now step two in the mosquito control process is ultimately a more permanent mosquito control solution, because it's actually going to interrupt that breeding cycle, but from the time you set up your mosquito trap to the time it's going to actually really start to notice that decline in the mosquito population is about four to six weeks.

So while that's a more permanent mosquito control solution this is going to be a more immediate mosquito control situation. That's why we recommend it for step three, because while you're implementing your four step mosquito control solution you are going to need something to help you out along the way, plus it's also great to keep around, and catch any strays that may wander into your outdoor living space.

This is our Terminex All Clear Backyard Mosquito Mister, and it's a great way to provide 2,000 square feet mosquito free area. It's also great for those of you who love to entertain, it's the perfect solution when you're going to have outdoor activities such as weddings, graduation parties, or just outdoor family gatherings.

It's really a simple product to use, you're simply going to fill the unit with water, and add your concentrate. And speaking of concentrates even though they have to be purchased separately it's quite a bonus to you, because you get to choose whether you want to use a pesticide to repel and kill mosquito's, or if you want to go the all-natural route, and make sure your family, pets and children are going to be mosquito free, as well as chemical and pesticide free as well.

The unit does require a cord, but it comes with a 30 foot cord so when you're considering placement around your property, you'll still be able to put it pretty much wherever you need to use it. But it is okay to use it with an extension cord as well.

Now one thing to consider when using your backyard mosquito mister is it does require a little bit of thought when it comes to placement, and that's because of the wind. The way this mister works is it's going to use that concentrate and mist it out, and it's going to kill or repel any mosquitos.

If the wind is blowing in the opposite direction of where you want it to spray, if you're trying to treat over here, and the wind is blowing this way, you're going to end up treating over here. So what you need to do is take a little thought, take a little time, and find out the right direction of the wind.

Ideally there's usually three main types that are going to be what you'd be experiencing, and that could be a single directional wind where it's coming from one way, and blowing across to the other way, or vice versa whichever way the wind is coming from, then there's a multi-directional wind which is what I'm thinking we're feeling here today where you know it's windy, but it's never really coming from the same place. And then there's an idle wind which I know we're not experiencing today at all which is where there's really not much of a breeze at all, and if there is one it's not very significant.

So depending on which type of breeze or wind direction you're experiencing you'll need to consider that when placing your mosquito mister so that you're actually treating the area that you want to treat.

It's also a vital step for our four step process to help get steps one and two taken care of, and repel any that might make it past those, and it's also a great, also portable system that you can take with you outside of your four step covered mosquito free zone.

So using a backyard mister either with the natural concentrate, or the synergized concentrate is going to provide you up to a 2,000 square feet mosquito free zone, and it's going to be able to eliminate 90% of your mosquito population for up to six hours. It doesn't get much better than that, especially when you're using this backyard mister in conjunction with our four step mosquito control process.

I hope you found this information helpful and remember check out our final step the fourth step in our four step process to ultimate mosquito control in our next video.
